

## Polished / Honed Concrete Product Information

Polished or Honed Concrete, is concrete that has had the surface mechanically ground to expose the aggregates within the concrete matrix. The concrete can be either fully polished (interior only) or a grind and seal finish can be installed (both interior and exterior). The difference between the two is that with a full polish, the concrete is polished to such a high degree that it almost resembles a glass surface. A grind and seal is where the concrete has been ground to expose the desired depth of stone and then a topical sealer is applied.

The concrete can be ground to varying depths depending on the desired look and the clients budget. For example, a salt and pepper finish is where the aggregates are just starting to be exposed (this is most popular) is going to be cheaper than a full depth grind, where the aggregates are cut nearly in half. This is more expensive as it is more time consuming, creates more waste, and puts far more wear on the grinding equipment.

- Beautiful high end, natural look of stone
- Very durable, hard wearing surface
- Look can be achieved both indoors and outdoors
- Oxides and coloured aggregates can be added if concrete is poured then polished
- Great for high foot traffic areas
- Used in both residential and commercial settings
